

FIGURE 1: All the genes of the secretory pathway reconstruction grouped by the processes they share.

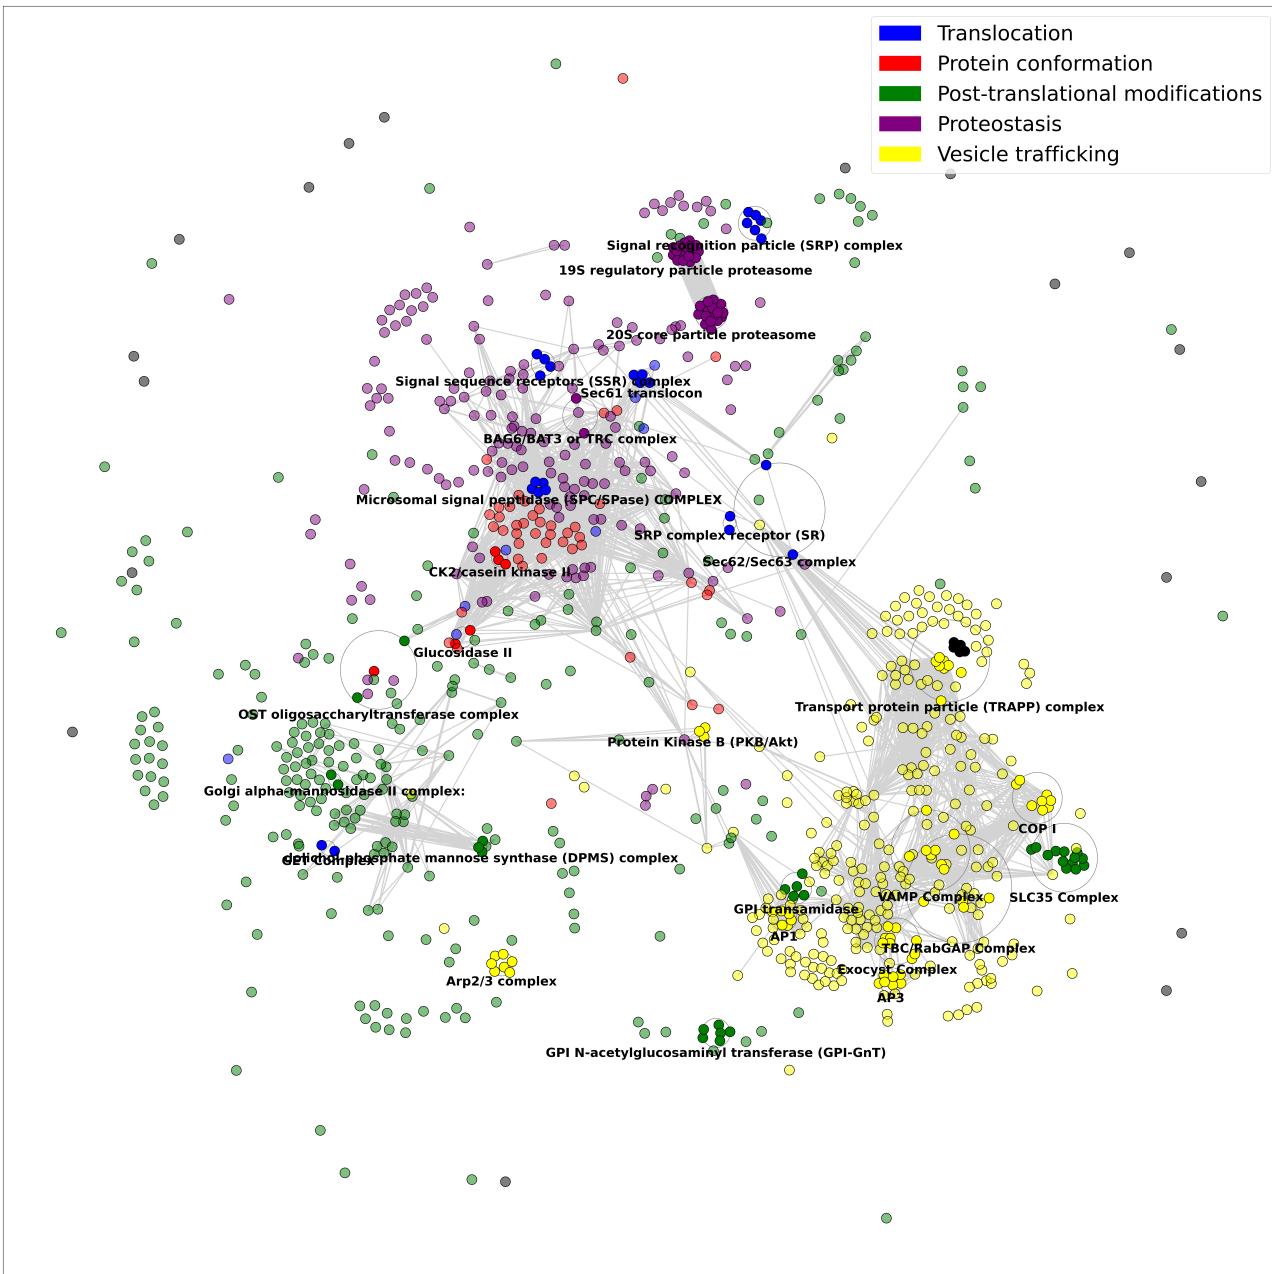

FIGURE 2: All the genes of the secretory pathway reconstruction grouped by, first the complexes they share, then by the processes they share. Genes that belong to complexes have a stronger color while genes that don't belong to complexes are more transparent.

Comparing to the previous plot you can see how genes that belong to the same complexes group very tightly. At the same time the general layout is similar to the previous plot meaning that the grouping by the processes is also running on the background.

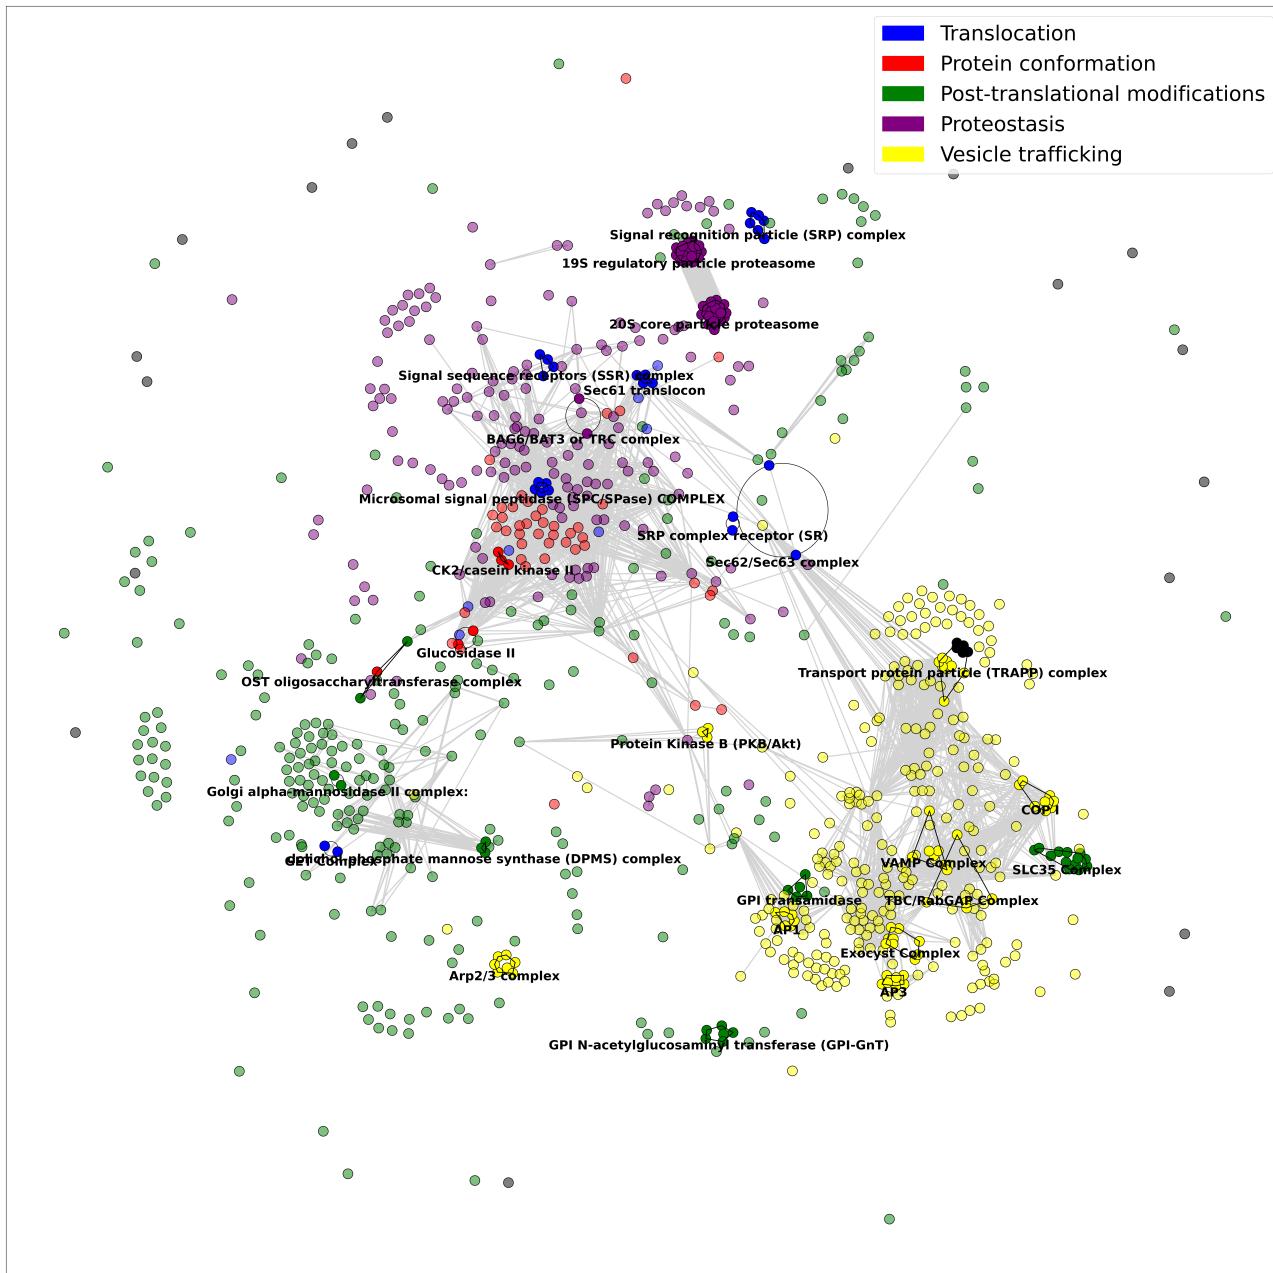

FIGURE 3: Same as Figure 2, with polygons instead of circles to define the complexes.
